ABSTRACT
In this paper I am trying to improve the on-line activity just like e-mail, Transaction, etc. Because statistics show that as much as 60 percent of business-critical data now resides in email, making it the most important repository of data your company may own. This huge amount of data which grows on a daily basis translates into a significant burden on corporate storage resources. These facts combined with a recent onslaught of regulatory compliance rules are forcing organizations to take a deeper look at email storage, retention, and archiving practices. it’s not just compliance with regulations that is driving this trend to archive. As email messages increasingly take center stage in headlines and lawsuits, email has become the electronic equivalent of DNA evidence. Having a system in place that takes this risk into account is crucial for businesses that don’t want to end up at the center of one of these scandals.

In this paper, I try to present IT professionals need to understand a range of business and technology issues from the key reasons for archiving to the best type of archive to meet those needs.

KEYWORDS: Email Archiving, Litigation, Storage management, Archiving policy, Archiving options, Regulatory compliance, Legal discovery.
